Time to make a blog about how the big guy is trying to crush the little guy. You think you are special. Better hope I don't have dirt on you.

Mark, Welcome to the list!

I was new to the list just like you once... and a few individuals did take the time to help me learn and get my foot in the door.. I thank them very much. It's very hard to find OBD-II information.. so perhaps I can help.

I've put up a few web pages...

Here, I hope we can all discuss OBD-II hacking/programming, NOT FOR PROFIT information only. If you are looking to steal hard work, and information for your own well being to get rich, I will ban you, block your IP, outcast you, mark you with a big red X.. the works. I hope we can all work together, learn and share information for the good of the OBD-II community.

Also, for the lurkers that are lawyers or have info regarding the not for profit aspect... I do need some assistance with the agreement. I would appreciate the help. Thanks.

Enjoy!

- Keith

I've put up a few web pages...

<http://obd2.dxsoftware.com>

On this page you will find some information about OBD-II, mainly the flash chips and the data they keep.. Hopefully I'll be updating this page as the day goes on and add more info in the up coming days. I will talk about how you can ready your Flash chip with an EMP-20 and what you can do once you have the data.

And to promote open OBD-II discussion, I have put up this web board:

Subject: [Gmeccm] OBDII

Hi all-

I'm new to the list and am looking for any and all info I can get on OBDII PCM programming.

There is very little info on the diy-efi site on OBDII and the PCM # I have is not in the list ([16200870](#)).

Any info/help would be great.

Thanks

-Mark j

Wow for profit huh?

< +12538805612

shit to lose you do. So this  
shit stops now

The difference between them and I is I don't need people to give me info or reverse engineer anything. I need someone who knows how to code and map stuff and when I find the right person to help I will make all gm tuning free. And then if hpt doesn't back the fuck off knowing I have all my own shit and even sold them stuff then I will do the same to ford and last dodge. Then I will go back and open another company outside the automotive industry and make plenty of money and watch them slowly fade away.

I suggest writing it in c++. Have a j2190 class that creates an kwp2000 or an iso15765. Makes code super portable.

59m

**Brian Humlicek**

I already have that covered, and it's all c# (your favorite ;)). It's still a work in progress. So far I have a complete j1979 base class and Ford 2190 class's that are complete enough to unlock an ecu (both pwm and can). I'm currently adding iso14229. It supports concurrent access which will allow things like simultaneous read or write of PCM and TCM, or nulling codes without interrupting a

**Tim Milliken** How about the nexus passwords?...

**Brian Humlicek**

I am half tempted to volunteer for this. I already have a pretty robust J2534 foundation that is finally coming together. It would be pretty cool to include full GM support in the public release. **Tim**, **Danny**, thoughts?

If anyone is interested in helping make GM ALL open source let me know. Here is the GM seed key logic. Time to take matters in my own hands. I have all the checksum algorithms and enough mapping info we can make GM completely open source from 98-17. What I don't have is enough time in the day.
